## Wireless Phone System For Small Businesses

By Mendelson Tiu | Tuesday | 2010-03-16

## Aria Technologies has launched an LG-Nortel W-SOHO wireless telephone system designed for small business.

Users only need to plug the W-SOHO base station into their telephone lines (up to three) and wirelessly connect up to seven additional W-SOHO handsets or W-SOHO desk phones to the network.

As a company grows, you can simply add new handsets and deskphones to your wireless telephone network. The system also comes with features usually associated with larger business telephone systems such as call conferencing, transfer, voicemail, intercom and hands-free.

General Manager of Aria Technologies, Rob Pierce said, "W-SOHO breaks the mould of traditional business telephone systems by removing the need for physical extension cabling, and giving you the freedom to roam around the office. With W-SOHO, we aim to offer small businesses an affordable and feature-rich phone system that doesn't require technicians, wiring, or any sort of additional infrastructure. As your business needs change over time, your phone system can effortlessly adapt accordingly."

The W-SOHO wireless telephone system is available from Aria Technologies as well as through the Telstra Business Systems program with the following recommended pricing:

- W-SOHO base station (minimum one base station required): \$1137
- W-SOHO wireless deskphone: \$421
- W-SOHO wireless handset: \$241
